

## ABSTRACT

When adding to a conventional medium such a  
function that allows it to have a value in its design as does a  
5 trading card, a design needs to be made while avoiding a  
through hole of about 10 mm long in diameter provided in the  
center of the medium, which substantially reduces the degree  
of freedom and the value of the design. An optical recording  
medium of the present invention is composed of one substrate,  
10 and the substrate has a circular or annular recess formed in  
one face thereof and a design put on the center of the other  
face thereof.
